AUTHOR: Bystrov, V.

TITLE: In the air - a miniature helicopter

SOURCE: Tekhnika molodezhi, no. 3, 1964, 14

TOPIC TAGS: jet helicopter, miniature helicopter

ABSTRACT: As an example of the scientific work being carried out by the students in the technical institutes of the RSFSR, the author describes a miniature helicopter designed by Yu. Pyatnitskiy and other students at the Kuybyshev Aviation Institute (Kuibyshev Aviation Institute) and consisting simply of a seat surmounted by two blades having jet motors at the tips. The fuel rises from the tank into the blades by centrifugal force and is burned in the jets. This simple device shows great promise as a cheap, safe means of transportation. "Photography by G. Gordayeva." Orig. art. has 1 figure.

TITLE: Investigation of the Chemical Shift of the Magnetic Resonance of Fluorine¹⁹ Nuclei in Fluorobenzenes With Fluorine-containing Substituents

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 2,
pp. 377-380

TEXT: It was the purpose of the present work to investigate the effect of fluorine-containing substituents upon the electron density distribution in the benzene ring, and to determine the interrelation between the structure of these compounds and their reactivity by means of nuclear magnetic resonance (nmr). The shift in the ring of monosubstituted fluorobenzenes caused by fluorine and referred to the resonance values of fluorine in nonsubstituted fluorobenzene was measured and determined from the equation:

$$\delta = \left(\frac{H_X - H_{C_6H_5F}}{H_{C_6H_5F}} \right) \cdot 10^6 / H_{C_6H_5F} \quad H_X \text{ and } H_{C_6H_5F} \text{ are resonance values of the}$$

external magnetic field for F¹⁹ nuclei in the case of substituted (X) and nonsubstituted fluorobenzene. Apparatus and method of measurement are described in Ref. 1. The values for δ are given in Table 1 for various substituents in o-, m- and p-position. The authors discuss the data given in publications for the interrelation between δ and the Hammett constant σ , they compare the values obtained from various calculations, and found that substituents with positive conjunction effect σ_c cause a meta-position, such with negative substitution effect, however, an ortho- or para-position. Tables 3 and 4 compare the values of δ_p , σ_p for the p-position and of δ_m , σ_m for meta-position. Besides, Table 3 gives the light absorption λ_{max} of 4'-substituted dimethylaminoazobenzene, which changes similar to the chemical shift in p-substituted fluorobenzenes, and indicates the existence of uniform electron displacements. There are 4 tables and 9 references: 3 Soviet, 7 US, and 1 French.

TITLE: A High-Resolution Nuclear Magnetic Resonance Apparatus

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No.1, pp.122-125

TEXT: The resolution of NMR spectrometers is determined by the following factors: (a) uniformity of the constant magnetic field over the volume of the specimen; (b) stability of the constant magnetic field in time; and (c) frequency stability of the radio-frequency magnetic field. In the NMR spectrometer described in the present paper a resolution of 10^{-7} was achieved, which means that all the above factors remain constant to within 1 in 10^7 . The apparatus has been used to record spectra of substances containing hydrogen and fluorine nuclei. Chemical shifts and the spin-spin interaction constant can be measured to an accuracy of better than 10%. The spectrometer incorporates a specially designed permanent magnet producing a field of 4530 oe. The magnet has the following features: (a) closed yoke, ensuring maximum rigidity; (b) fine and continuous adjustment of Card 1/5

the parallelism of the working surfaces of the pole-pieces; (c) special coils are located on the poles and are used to modulate and adjust the field; (d) the gap length is 3.2 cm and the diameter of the working surface of the pole-pieces is 22 cm. In order to achieve a highly uniform magnetic field the pole pieces have a thickness of 6 cm and are specially annealed in a hydrogen atmosphere. The working surfaces are plane to within $\pm 0.5 \mu$. The relative nonuniformity of the magnetic field in the central region does not exceed 2×10^{-6} over a volume of 1 cm³. Fig.2 shows the magnetic field chart in the central part of the gap. The probe is illustrated in Fig.3. The substance under investigation is placed in the thin-walled glass ampoule 3 which is rotated at a rate of 10 000 rpm by a small air turbine. The ampoule is held in position by the perspex rotor 2 of the turbine. The lower end of the ampoule is centred by a teflon bush 6 and rests on the perspex plate 7. The body of the probe 5 is made from red copper. The coil is wound on the perspex former 4. The oscillator is quartz stabilized and works on the 3rd

harmonic of the mechanical oscillations of the quartz resonator. Detailed circuits of the quartz oscillator and various amplifiers etc. are given. Fig.5 shows a typical spectrum obtained for ethyl alcohol. The volume of the specimen was 4 mm³ and the time taken to record the spectrum was 50 sec. In general, the volume of the specimen lies between 4 and 15 mm³. Acknowledgements are expressed to K.V. Vladimirskiy for valuable advice. There are 5 figures and 8 references: 1 Soviet and 7 non-Soviet.

TITLE: Structural analysis of chemical compounds based on their
nuclear magnetic resonance spectra. Communication 2.
Determination of the structure and conformation of some
substituted cyclopentenones

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
khimicheskikh nauk, no. 1, 1963, 66-74

TEXT: The synthesis of the erythro isomer IA and threo isomer IB of 3,5-dimethyl-5-(α -acetoxyethyl)- Δ^2 -cyclopentenone by condensation of 3,5-dimethyl- Δ^2 -cyclopentenone with vinyl acetate has already been described (Izv. AN SSSR, Otd. khim. n., in press). That reaction also produced the erythro and threo isomer of 3,5-dimethyl-5-(α -acetoxyethyl)- Δ^3 -cyclopentenone (IIA, IIB) and the 2-ethylidene-3,5-dimethyl- Δ^4 -cyclopentenone (III). By analyzing the high resolution proton magnetic resonance (p.m.r.) spectra it was possible to define the structure and conformation of IA,

Card 1/4

S/062/63/000/001/009/025
B101/B186

Structural analysis of chemical ...

IB and III as well as of 3,5-dimethyl- Δ^2 -cyclopentenone (IV), 3,5-dimethyl- Δ^4 -cyclopentenone (V), 3,5-dimethyl-5-vinyl- Δ^2 -cyclopentenone (VI), 3,5-dimethyl-5-(α -acetoxyethyl)-cyclopentanone (VIIA; VIIIB), 3,5-dimethyl-5-(α -hydroxyethyl)- Δ^2 -cyclopentenone (VIIIA, VIIIB), and 3,5-dimethyl-5-(α -hydroxyethyl)-cyclopentanone (IXA) which were synthesized for comparison. The p.m.r. spectra of 0.2-0.5 M solutions in CCl_4 were taken at room temperature and at 20.529 Mc. Hexamethyl disiloxane was used as internal standard. The spectra were analyzed according to J. T. Arnold and M. E. Packard (J. Chem. Phys., 19, 1608 (1951)). The slight difference between the spectra of IA and IB led to the conclusion that there is no structural difference but only a different steric orientation of the groups; this was confirmed by converting IA and IB into VI. Equally, IXA was obtained by hydrogenation from VIIIA as well as from VIIIB. Conclusions: The isomerism is based on a different position of the substituents at the asymmetric C_6 atom. Two steric series are possible with 3 conformations each (Fig. 6). One of these conformations must outnumber the two other. The IR spectra of VIIIA, VIIIB and IXA showed that an intramolecular H bond exists at the hydroxy group of VIIIA and IXA, which is absent in VIIIB.

Card 2/4

Structural analysis of chemical ...

S/062/63/000/001/009/025
B101/B186

Hence, the compounds IA, VIIA, VIIIA and IXA have the structure a with predominant conformation β a, the isomer compounds IB, VIIB and VIIIB have the structure b with predominant conformation β b. The structure of III was confirmed by the p.m.r. spectrum. The p.m.r. spectra of IIA and IIB were not taken, since these isomers could not be separated. There are 7 figures and 1 table.

TITLE: Study of the hydrogen bond by the n.m.r. method. Effect of steric hindrances on the hydrogen bond in di-orthoalkylphenols

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 148, no. 5, 1963, 1077 - 1080

TEXT: The steric screening effect of the OH group on the hydrogen bond of some di-orthoalkylphenols was studied by protonmagnetic resonance with the aid of the RMP-YC-2 (YaMR-US-2) spectrometer at a frequency of 20.529 Mc at $20 \pm 2^\circ\text{C}$. The chemical shift of the protonmagnetic resonance signals τ was measured in the spectra of 2,6-xylene-, 2,6-diisopropylphenol and ionone(2,6-di-tert-butyl-4-methylphenol) as a function of their concentration in dry, alcohol-free CCl_4 , ether, acetone, and triethylamine. The measurements RMS error: ± 0.02 showed that the change in the chemical shift of τ due to the OH group may be attributed entirely to the effect of the intermolecular hydrogen bond. When the substances investigated are diluted in ether, acetone and triethylamine, the τ are shifted towards a comparatively weak field, while, when they are diluted in CCl_4 they are shifted

Card 1/3

Study of the hydrogen bond by...

S/020/63/148/005/017/029
B117/B186

towards a stronger field. This shows that in the latter case the hydrogen bond between the phenol molecules is weaker. The importance of steric screening (volume of ortho-substituents) for cyclic association, in which mainly tetramers and only small amounts of dimers are formed, was studied in some alkylphenols dissolved in CCl_4 . When the number of ortho-substituents is increased, the band of the bound hydroxyl is shifted to higher frequencies and the shift from the H bond $\Delta\tau$ becomes smaller, probably due to its effective elongation. Owing to the weakening of the hydrogen bond the inhibiting activity decreases in the following order: 2,6-dimethyl-, 2,6-diisopropyl and 2,6-di-tert-butylphenyl, and a further growth of the $\text{C}_6\text{-C}_8$ radicals is prevented. In di-ortho-alkylphenols, dissolved in CCl_4 at low concentrations the chemical shift of τ on a horizontal section is dependent on the concentration. When the number of ortho-substituents is increased the "saturation" of this dependence takes place in the region of higher concentrations. In 2,6-di-tert-butylphenol and ionone, the shift of the hydroxyl is independent of the concentration. A comparison of the shifts of the hydroxyl signal $\Delta\tau$ on transition from the pure substance to the zeroth phenol concentration showed that the electron cloud of the O-H

Card 2/3

Study of the hydrogen bond by...

S/020/63/148/005/017/029
B117/B186

bond is considerably influenced by the substituents. When the alkyl group in o-position is introduced, the effect of the electric dipole field of the C-H bond can be assumed as one of the reasons for the change in the shift of the OH signal. This was confirmed by introducing a methyl group instead of hydrogen. The effect of substituents on the chemical shift of the OH group of phenols is at present being studied in detail. There are 4 figures and 1 table.

AUTHOR: Vasil'yev, G. S.; Prilezhiyeva, Ye. N.; Bystrov, V. F.; Shostakovskiy, M. F.ORG: Institute of Organic Chemistry im. N. D. Zelinskiy, AN SSSR (Institut organicheskoy khimii AN SSSR)TITLE: Structure of products of the reaction of (alkoxy)alkylthiobutenynes with phosphorus pentachlorideSOURCE: Zhurnal obshchey khimii, v. 35, no. 8, 1965, 1350-1357

TOPIC TAGS: phosphorus chloride, chemical reaction, proton resonance, organic sulfur compound

ABSTRACT: Synthesis by other methods and study of proton magnetic resonance spectra indicated that addition of PCl_5 to 1-alkylthio-(alkoxy)butenynes takes place at the triple carbon-carbon bond with the formation of chlorides of 1-alkylthio(alkoxy)-3-chlorobutadiene-1,3,4-phosphinic acids.¹ It was established for the first time that addition of alcohols to diacetylene under the conditions of a nucleophilic reaction proceeds stereospecifically with the formation of cis-1-alkoxybutenynes. The reaction of diacetylene with one molecule of a thiol (MeSH) under nucleophilic conditions also resulted in a product (1-Me-thiobutynne) with a cis-structure. It was shown that in products of the addition of PCl_5 to

ACC NR: AP6019317

1-alkylthio(alkoxy)butenynes the hydrogens at 1-C and 2-C are in a trans-position to each other. A mechanism of electrophilic interaction between PCl_5 and 1-alkylthio(alkoxy)butenynes is proposed which explains the cis-trans-isomerization that takes place in its course. International symposium on macromolecular chemistry. Moscow, 1960.

Mosfilmnaukodiz. simposium po makromolekul'noj chimi. SSSR, Mol'va, 14-18 iyunya 1960 g.; doklad 1 avtorskij. Sastava, III. (International Symposium on Macromolecular Chemistry). Held in Moscow, June 14-18, 1960; Papers and Summaries, Section III. [Moscow, Izd-vo AN SSSR, 1960]. 469 p. 25,000 copies printed.

Tech. Ed.: P. S. Kabinov.

Sponsoring Agency: The International Union of Pure and Applied Chemistry. Commission on Macromolecular Chemistry.

PURPOSE: This book is intended for chemists interested in polymerization reactions and the synthesis of high molecular weight compounds.

COVERAGE: This is Section III of a multivolume work containing papers on macromolecular chemistry. The articles are general and deal with the kinetics of polymerization reactions, the synthesis of special-purpose polymers, ion exchange resins, semiconductor materials, etc., methods of catalyzing polymerization reactions, properties and chemical interactions of high molecular materials, and the effects of various factors on polymerization and the degradation of high molecular compounds. No personalities are mentioned.

6. SOURCE: Izobret prom obraz tov zni, no. 15, 1966, 94

7. TOPIC TAGS: seismologic station, seismologic instrument

ABSTRACT: This Author Certificate presents a seismic station containing a seismic signal detector, a recording amplifier unit, an oscilloscope, a magnetic drum recorder, a channel reproduction unit, a control unit, a reproduction amplifier, a multichannel borehole probe, a drum with photographic paper, a retransmitting unit, and a power supply. To increase the reliability when transferring from operation with the method of reflected waves to the method of refracted waves, a filter unit is connected between the first and second stages of the recording amplifier unit. A

modulator-demodulator unit and a reel type magnetic recorder are connected in series to the output of the recording amplifier unit. For operation with the method of refracted waves, the filter unit has frequency cutoffs of 7--30 hz, and for operation at sea--frequency cutoffs of 20--50 hz. To increase the reliability of the recorded data with operation by the method of regulated directional reception, a switching unit for the channels to be summed, a static correction unit, and a summing unit are connected in series between the magnetic drum recorder and the reproduction amplifier. To increase the reliability when transferring from operation with the method of reflected waves to seismic logging, a frequency selection unit is connected between the multichannel borehole probe and the magnetic drum recorder. To improve the quality of the recorded material, an electron beam unit for introducing static and dynamic corrections is connected between the reproduction amplifier and the drum with photographic paper.

The determination of Act X from its emanation in the presence of considerable quantities of Th X. B. N. Bystroff. Compt. rend. acad. sci. U.R.S.S. 52, 117-10 (1946) (in English).—An air stream is passed at moderate velocity through the active sample of Th X and Act X and then through two ionization chambers of 1000 ml. each which differ in electrostatic capacity and sensitivity. The air speed is adjusted so that the α -activity caused by Th will be the same in both ionization chambers. Since chambers is detd., the app. is now insensitive to Th. Any measured current is due to An, which decomp. completely in the first chamber. With an air-stream velocity of 104 cu. cm./sec., sensitivities of 6×10^{-10} g./division/min. for Act X and 8.4×10^{-11} g./division/min. for Th were attained. Peter M. Bernays.

TITLE: Determining the time of growth of the discharge in directly heated tubes

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 4, 1962, abstract 4-3-65a (Izv. Leningr. elekrotekhn. in-ta, 1961, no. 45, 101-111)

TEXT: Analytical relationships between the duration of the first stage of discharge growth in a pulse thyratron and the shape of the grid voltage pulse, gas pressure and electrode spacing are derived, the first stage being considered as starting with the application of a positive grid pulse and going on up to the instant of considerable increase of the grid current. In order to derive approximate formulas, the following assumptions were made: The field between cathode and grid is uniform, not distorted by space charges; the basic ionization process consists of a single ionization by collision of gas atoms by electrons leaving the cathode.

TITLE: The problem of the mechanism of developing a discharge in sectionalized high-voltage thyratrons

PERIODICAL: Referativnyy zhurnal, Fizika, no. 11, 1962, 26,
abstract 11-3-51shch ("Izv. Leningr. elektrotekhn. in-ta",
no. 46, 1961, 14 - 22)

TEXT: An investigation was carried out of the mechanism of developing a discharge in sectionalized thyratrons for a case in which the design of intermediate electrodes eliminates the possibility of a direct transit of the electrons from the cathode to the anode. The authors assume that, in this case, there exists a successive discharge firing (beginning with the first one) to the intermediate electrodes. As a result, the voltage between the sections, in which the discharge did not develop yet, will increase, and, at some moment, the whole anode voltage will happen to be applied between the last intermediate electrode and the anode. Within a given time, the velocities of the electrons passing

through this last intermediate space, must change from the maximum magnitude, which is determined by the anode voltage, to the speed determined by the intensity of the discharge burning in the device. To confirm the hypothesis brought forth, an investigation was conducted on the distribution of the electrons by their speeds, which arrive at the anode of the sectionalized thyratron during the discharge generation. The investigations were carried out with a model of a thyratron, on the anode-end-surfaces of which were made two openings for the lead of the electrons from the last intermediate space. Having penetrated to the space beyond the anode, the beam of the electrons hit the fluorescent screen serving as an indicator of the magnitude of the electron deflection under the action of the magnetic field which was established between the screen and the thyratron anode. Considering the analytical expression for the distribution of the field along the path of the electrons, the authors determine their highest velocity by the minimum magnitude of the beam deflection on the screen. It was determined that this velocity corresponds to the magnitude of the voltage blanked by the thyratron. This confirms, to a certain extent, the said hypothesis on the successive firing of a discharge to the intermediate electrodes in the sectionalized thytratrons. There are 3 references.
